ABSTRACT

The Labor Registry System is a collection of data in a barangay. Employed and unemployed individuals are going to register. It is a program created in Microsoft Visual Studio. All the data was gathered from the barangay and stored in the Database Worker Registry. The system provides the job status and personal information of the residents in Barangay La Paz, San Narciso, and Zambales. It is an automated database that is very useful for the barangay to monitor the current labor status. Citizen records are essential because they are permanent records of a citizen. The system provides information on employed and unemployed workers, including whether the worker is a college graduate, high school graduate, or undergraduate. The gathered data will be used as a recommendation when a company or agency needs a worker. This system can help employers find workers who are available and will contribute positively to the community, which can decrease unemployment rates.
